DETAILED ACTION

1. Claims 3, 11-12, 15, 19, 22, and 25 have been cancelled.
2. Claims 8, 17, and 24 have been amended.
3. Claims 1-2, 4-10, 13-14, 16-18, 20-21, 23-24 and 26 are pending.

Response to Arguments

1. Applicant's arguments filed 30 March 2009 have been fully considered and they are persuasive.

Response to Amendment

2. Applicant's request for reconsideration of the finality of the rejection of the last Office action is persuasive and, therefore, the finality of that action is withdrawn.

Allowable Subject Matter

3. Claims **1-2, 4-10, 13-14, 16-18, 20-21, 23-24 and 26** are allowed.

The following is an examiner's statement of reasons for allowance: The present invention is directed toward a method and apparatus for assigning trust to a key. This technique will provide security by associating a secret value such as a key within in a software module seeking access to data and/or services for which access may be restricted. Claims 1, 13, and 20 identifies the uniquely distinct features "**reading from a software module embedding one of a set of key associated with a trusted source, determining whether a key is traceable to one of the set of keys comprising a digital signature of the software module binary**". Claim 8 identifies the uniquely distinct features "**making the document available on a communication network by which computer systems comprising the software module binary may read the**

Art Unit: 2437

document". Claim 17 identifies the uniquely distinct features **"wherein the key is traceable to one of the keys in the set of keys embedded in the software module binary by way of a certificate chain"**. Claim 24 identifies the uniquely distinct features **"wherein the identification of the software module binary comprises a hash value of the software module binary"**.

The closest prior art, Grimmer (US Patent No. 5,774,552) discloses a method and apparatus for reading a set of keys from a database (i.e. Certificate Authority or LDAP) and storing the public key within an external database.

However, either singularly or in combination, Grimmer fail to anticipate or render obvious the claimed limitation of reading from a software module embedding one of a set of key associated with a trusted source.

The closest prior art, Van Oorschot (US Patent No. 6,215,872) discloses a method and apparatus for creating trust within a secure communication system by allowing end-users to obtain trusted public keys from associated authorities.

However, either singularly or in combination, Van Oorschot fail to anticipate or render obvious the claimed limitation of one of a set of keys are embedded within a software module.

The closest prior art, Fischer (US Patent No. 5,214,702) discloses a public key cryptographic system is disclosed with enhanced digital signature certification which authenticates the identity of the public key holder. A hierarchy of nested certifications and signatures are employed which indicate the authority and responsibility levels of the individual whose signature is being certified. The certifier in constructing a certificate

Art Unit: 2437

generates a special message that includes fields identifying the public key which is being certified, and the name of the certifier. The certificate is constructed by the certifier to define the authority which is being granted and which may relate to a wide range of authorizations, delegation responsibilities or restrictions given to, or placed on the certifier. Methodology is also disclosed by which multiple objects such as, for example, a cover letter, an associated enclosed letter, an associated graphics file, etc., are signed together. Methodology is also disclosed for digitally signing documents in which a digital signature is generated for both computer verification and for reverification if a document needs to be reconfirmed by reentering from a paper rendition.

However, either singularly or in combination, Fischer fail to anticipate or render obvious the claimed limitation of reading from a software module embedding one of a set of key associated with a trusted source.

The closest prior art, Spelman et al. (US Patent No. 5,680,458) discloses a method of recovering from a compromise of a root key which is the private key of a first public key-private key pair, the method including the steps of electronically sending out an emergency message indicating that the root key has been compromised and also containing a replacement key and a digital signature which was generated by using the root key; and publishing in an out-of-band channel a value V, wherein V is derived from the emergency message.

However, either singularly or in combination, Spelman et al. fail to anticipate or render obvious the claimed limitation of digitally signing the document using a key

Art Unit: 2437

presented by or read from the document and traceable to one key of a set of keys wherein the set of keys is embedded in the software module binary.

3. Therefore, **claims 1, 8, 13, 17, 20, and 24** and the respective **dependent claims 2, 4-7, 9-10, 14, 16, 18, 21, 23, and 26** are in condition for allowance.

Conclusion

4. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
